

## Description

The PJ71B series is a set of three-terminal low power high voltage regulators implemented in CMOS technology. They allow input voltages as high as 30V. They are available with several fixed output voltages ranging from 2.8V to 9.0V. Because of the low power dissipation, PJ71B series are widely used in a variety of equipment such as audio device, video device, communication device and so on.

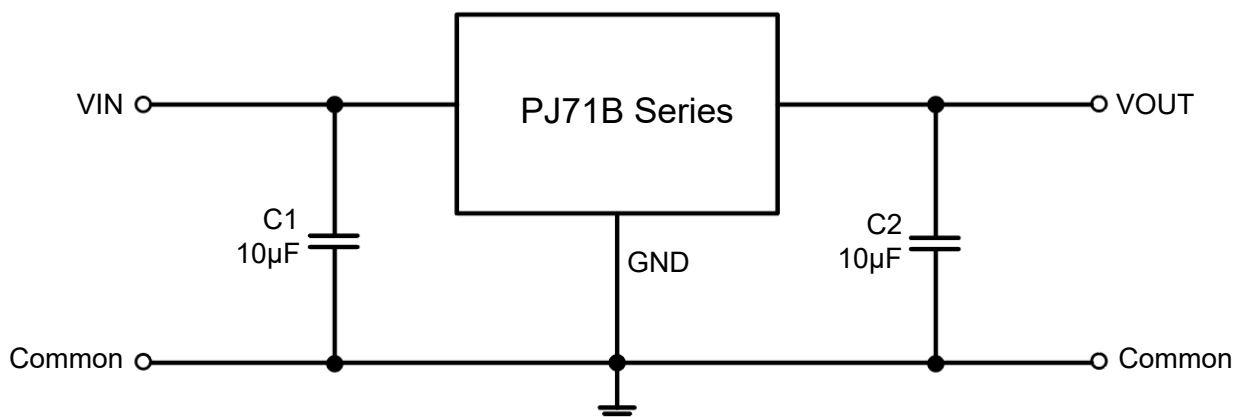

## Features

- High Input Voltage Rating: Up to 30V
- Maximum Output Current: 100mA
- Standard Fixed Output Voltage Options: 2.8V,3V,3.3V,3.6V,4V,4.4V,5V and 9V
- Low Quiescent Current: 1.5uA
- PSRR=dB@1KHz
- Low Dropout : 100mV(Max.) @ 1mA
- Low Output Voltage Accuracy:  $\pm 2\%$
- Low Power Consumption
- Low Temperature Coefficient
- Available Packages: SOT-23, SOT-23-3 and SOT-89

## Applications

- Battery-Powered Equipment
- Communication Equipment
- Audio/Video Equipment

**Note 1.** The dropout voltage is defined as  $V_{IN} - V_{OUT}$ , when  $V_{OUT}$  is 98% of the normal value of  $V_{OUT}$ .

### Functional Description

#### Input Capacitor

A 10 $\mu$ F ceramic capacitor is recommended to connect between VIN and GND pins to decouple input power supply glitch and noise. The amount of the capacitance may be increased without limit. This input capacitor must be located as close as possible to the device to assure input stability and less noise. For PCB layout, a wide copper trace is required for both VIN and GND.

#### Output Capacitor

An output capacitor is required for the stability of the LDO. The recommended minimum output capacitance is 10 $\mu$ F, ceramic capacitor is recommended, and temperature characteristics are X7R or X5R. Higher capacitance values help to improve load/line transient response. The output capacitance may be increased to keep low undershoot/overshoot. Place output capacitor as close as possible to VOUT and GND pins.

#### Thermal Considerations

For continuous operation, do not exceed absolute maximum junction temperature. The maximum power dissipation depends on the thermal resistance of the IC package, PCB layout, rate of surrounding airflow, and difference between junction and ambient temperature. The maximum power dissipation can be calculated by the following formula :

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / R_{\theta JA}$$

Where  $T_{J(MAX)}$  is the maximum operation junction temperature 125 °C,  $T_A$  is the ambient temperature and the  $R_{\theta JA}$  is the junction to ambient thermal resistance.

The power dissipation definition in device is :

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} + V_{IN} \times I_Q$$

#### Layout Consideration

By placing input and output capacitors on the same side of the PCB as the LDO, and placing them as close as is practical to the package can achieve the best performance. The ground connections for input and output capacitors must be back to the PJ71B Series ground pin using as wide and as short of a copper trace as is practical. Connections using long trace lengths, narrow trace widths, and connections through via must be avoided. These add parasitic inductances and resistance that results in worse performance especially during transient conditions.

### Conditions of Soldering and Storage

#### ◆ Recommended condition of reflow soldering

Recommended peak temperature is over 245°C. If peak temperature is below 245°C, you may adjust the following parameters:

- Time length of peak temperature (longer)
- Time length of soldering (longer)
- Thickness of solder paste (thicker)

#### ◆ Conditions of hand soldering

- Temperature: 300°C
- Time: 3s max.
- Times: one time

#### ◆ Storage conditions

- **Temperature**  
5 to 40°C
- **Humidity**  
30 to 80% RH
- **Recommended period**  
One year after manufacturing
